

Project Proposal

Project Title:

E-Library for Research Papers

Objective:

The objective of this project is to design and implement a database-driven platform where students and researchers can upload, search, and access research papers efficiently. The system aims to provide an organized repository of academic work, enabling easy retrieval through keywords, categories, and author searches. In later stages, the system will also support plagiarism detection and recommendation features to enhance research quality and collaboration.

Key Features:

- **User Management:** Students and researchers can register, log in, and upload papers.
- **Research Paper Repository:** Upload, store, and manage research papers in categorized formats.
- **Search Functionality:** Search papers by keyword, category, and author.
- **Citations Tracking:** Maintain citation relationships between papers.
- **Plagiarism Checker (Advanced):** Basic similarity detection to avoid duplicate submissions.
- **Recommendation Engine (Advanced):** Suggest related papers based on category and citations.

Team Members:

Moaz Kashif (23L-2626)
Umer Khalid (23L-2599)
Hamza Mumtaz (23i-2635)

Industry Relevance:

With the rapid growth of digital academic platforms such as **Google Scholar, IEEE Xplore, and ResearchGate**, the demand for centralized e-libraries has become a cornerstone of modern education and research. Universities, research institutions, and even corporate R&D departments now heavily rely on digital repositories to streamline access to scholarly content. Our project directly aligns with these industry trends by preparing us to design and manage real-world **database-driven academic publishing systems, digital libraries, and research management platforms**. The skills gained from this project — including schema design, efficient querying, plagiarism detection, and recommendation engines — are highly valuable and immediately applicable in the academic technology sector and beyond.
